

PERMANENT MAKEUP

STAGES OF HEALING

@ericaroyball

1-4 DAYS

The new pigment appears more intense than expected. Oxidation and blood rushing to the skin's surface darken the appearance of the pigment.

2-7 DAYS

The pigment color will be significantly softer and less bright. The "disappearing act" is due to the immaturity of the epidermal cells. These cells have been exposed to pigment and the sloughing process is disrupted. The area will have a milky cast which will diffuse the original chosen color. The pigment doesn't travel anywhere. It's just not as visible through the "veil" of tissue during the wound-rebuilding stage.

7-60 DAYS

Translucency is slowly restored. While these injected pigment tones may initially simulate the exact color chosen, they will not always be a perfect match. The tones of the injected pigment remain constant, while the skin tones change depending upon exposure to cold, heat, sun, circulatory changes, and medications.

BEFORE CARE INSTRUCTIONS

EYEBROWS @ericaroyball

30 DAYS PRIOR AVOID

- Chemical Peels
- Sun/tanning
- Retin-A/retinol products

30 DAYS PRIOR

- Moisturize the area with heavy ointment at night.

NOTE

Sensitivity increases during the menstrual cycle. No doctor prescribed medication should ever be discontinued without first consulting your physician.

14-21 DAYS PRIOR AVOID

- Botox/neurotoxins in forehead area

24 HOURS PRIOR

AVOID

- Exercise
- Alcohol
- Caffeine
- Non-prescribed mood-altering drugs
- Fish Oil
- Prenatal Vitamins
- "Hair, Skin, Nail" supplements

NIGHT PRIOR TO TREATMENT

Take anti-histamine the night before, which may help control swelling.

DAY OF TREATMENT

- Ensure lips do not have dry chapped skin.
- Stay hydrated.
